## JEE (ADVANCED) 2024 PAPER-2

## [PAPER WITH SOLUTION]

## HELD ON SUNDAY $26^{\text {TH }}$ MAY 2024

## PHYSICS

## SECTION 1 (Maximum Marks :12)

- This section contains FOUR (04) questions.
- Each question has FOUR options (A), (B), (C) and (D). ONLY ONE of these four options is the correct answer.
- For each question, choose the option corresponding to the correct answer.
- Answer to each question will be evaluated according to the following marking scheme:

Full Marks : +3 If ONLY the correct option is chosen;
Zero Marks : 0 If none of the options is chosen (i.e. the question is unanswered);
Negative Marks : -1 In all other cases.
[:Q.1] A region in the form of an equilateral triangle (in $x-y$ plane) of height $L$ has a uniform magnetic field $\vec{B}$ pointing in the +z-direction. A conducting loop $P Q R$, in the form of an equilateral triangle of the same height $L$, is placed in the $x-y$ plane with its vertex $P$ at $x=0$ in the orientation shown in the figure. At $t=0$, the loop starts entering the region of the magnetic field with a uniform velocity $\vec{v}$ along the +x-direction. The plane of the loop and its orientation remain unchanged throughout its motion.

Which of the following graph best depicts the variation of the induced emf $(E)$ in the loop as a function of the distance $(x)$ starting from $x 0$ ?
[:A]

[:B]

[:C]

[:D]

[:ANS] A
[SOLN]

Mentors Eduserv: Parus Lok Complex, Boring Road Crossing, Patna-1 Helpline No. : 9569668800 | 7544015993/4/6/7

For $0<x<L$
$\left|\varepsilon_{\text {ind }}\right|=B(a b) \vee$,as $x$ increases length ab increases $\left|\varepsilon_{\text {ind }}\right|$ increases
For $L<x<\frac{3 L}{2}$
$\varepsilon_{\text {ind }}$ will become zero
Then sign of $\varepsilon_{\text {ind }}$ will change
[:Q.2] A particle of mass $m$ is under the influence of the gravitational field of a body of mass $M$ (>> $\mathrm{m})$. The particle is moving in a circular orbit of radius $\mathrm{r}_{0}$ with time period To around the mass M. Then, the particle is subjected to an additional central force, corresponding to the potential energy $V_{C}(r)=m \alpha / r^{3}$, where $\alpha$ is a positive constant of suitable dimensions and $r$ is the distance from the center of the orbit. If the particle moves in the same circular orbit of radius $r_{0}$ in the combined gravitational potential due to $M$ and $V_{c}(r)$, but with a new time period $T_{1}$, then $\left(\mathrm{T}_{1}{ }^{2}-\mathrm{T}_{0}{ }^{2}\right) / \mathrm{T}_{1}{ }^{2}$ is given by
[ $G$ is the gravitational constant.]
[:A] $\frac{3 \alpha}{\mathrm{GMr}_{0}^{2}}$
[:B] $\frac{\alpha}{2 \mathrm{GMr}_{0}^{2}}$
[:C] $\frac{\alpha}{\mathrm{GMr}_{0}^{2}}$
[:D] $\frac{2 \alpha}{\mathrm{GMr}_{0}^{2}}$
[:ANS] A

$\frac{\mathrm{GMm}}{\mathrm{r}_{0}^{2}}=\mathrm{mr}_{0} \omega_{0}^{2}$
$\omega_{0}^{2}=\frac{\mathrm{GM}}{\mathrm{r}_{0}^{3}}$
$U(r)=\frac{m \alpha}{r^{3}}$

$$
\begin{aligned}
& \Rightarrow \mathrm{f}_{\mathrm{c}}=-\frac{\mathrm{dU}}{\mathrm{dr}}=\frac{3 \mathrm{~m} \alpha}{\mathrm{r}^{4}} \\
& \Rightarrow \frac{\mathrm{GMm}}{\mathrm{r}_{0}^{2}}-\frac{3 \mathrm{~m} \alpha}{\mathrm{r}_{0}^{4}}=\mathrm{mr}_{0} \omega_{1}^{2} \\
& \omega_{1}^{2}=\frac{\mathrm{GM}}{\mathrm{r}_{0}^{3}}-\frac{3 \alpha}{\mathrm{r}_{0}^{5}} \\
& \frac{\mathrm{~T}_{1}^{2}-\mathrm{T}_{0}^{2}}{\mathrm{~T}_{1}^{2}}=\frac{\left(\frac{2 \pi}{\omega_{1}}\right)^{2}-\left(\frac{2 \pi}{\omega_{0}}\right)^{2}}{\left(\frac{2 \pi}{\omega_{1}}\right)^{2}}=\frac{\omega_{0}^{2}-\omega_{1}^{2}}{\omega^{2}} \\
& =\frac{\frac{\mathrm{GM}}{\mathrm{r}_{0}^{3}}-\left(\frac{\mathrm{GM}}{\mathrm{r}_{0}^{3}}-\frac{3 \alpha}{\mathrm{r}_{0}^{5}}\right)}{\frac{\mathrm{GM}}{\mathrm{r}_{0}^{3}}} \\
& =\frac{3 \alpha}{\mathrm{GMr}_{0}^{2}}
\end{aligned}
$$

[:Q.3] A metal target with atomic number $Z=46$ is bombarded with a high energy electron beam. The emission of $X$-rays from the target is analyzed. The ratio $r$ of the wavelengths of the $\mathrm{K}_{\alpha}$-line and the cut-off is found to be $\mathrm{r}=2$. If the same electron beam bombards another metal target with $Z=41$, the value of $r$ will be
[:A] 2.53
[:B] 1.27
[:C] 2.24
[:D] 1.58
[:ANS] A
[SOLN] $v=a^{2}(z-b)^{2}$, for $k_{\alpha}$
$\frac{c}{\lambda}=a^{2}(z-b)^{2}, a=\sqrt{\frac{3 R C}{4}}$
$b \simeq 1$
$\lambda_{\mathrm{k}_{\alpha}} \propto \frac{1}{(z-1)^{2}}$
$\frac{\left(\lambda_{\mathrm{k}_{\alpha}}\right)_{41}}{\left(\lambda_{\mathrm{k}_{\alpha}}\right)_{46}}=2 \times \frac{(46-1)^{2}}{(41-1)^{2}}$
$=2.53$
Cut off wave length will be same in both cases as the beam is same
[:Q.4] A thin stiff insulated metal wire is bent into a circular loop with its two ends extending tangentially from the same point of the loop. The wire loop has mass $m$ and radius $r$ and it is in a uniform vertical magnetic field $B_{0}$, as shown in the figure. Initially, it hangs vertically downwards, because of acceleration due to gravity g , on two conducting supports at P and Q . When a current $I$ is passed through the loop, the loop turns about the line PQ by an angle $\theta$ given by

[:A] $\quad \tan \theta=\pi \mathrm{rlB} \mathrm{B}_{0} /(\mathrm{mg})$
[:B] $\quad \tan \theta=2 \pi r l B_{0} /(\mathrm{mg})$
[:C] $\tan \theta=\pi \mathrm{rl} \mathrm{B}_{0} /(2 \mathrm{mg})$
[:D] $\quad \tan \theta=\mathrm{mg} /\left(\pi \mathrm{rlB} \mathrm{B}_{0}\right)$
[:ANS] A
[SOLN]

For equilibrium $\tau_{B}=\tau_{m g}$
$\mathrm{i} \times \pi \mathrm{r}^{2} \mathrm{~B} \sin (90-\theta)=m g r \sin \theta$
$\tan \theta=\frac{\pi \mathrm{irB}}{\mathrm{mg}}$

## SECTION 2 (Maximum Marks :12)

- This section contains THREE (03) questions.
- Each question has FOUR options (A), (B), (C) and (D). ONE OR MORE THAN ONE of these four option(s) is(are) correct answer(s).
- For each question, choose the option(s) corresponding to (all) the correct answer(s).
- Answer to each question will be evaluated according to the following marking scheme:

Full Marks : +4 ONLY if (all) the correct option(s) is(are) chosen;
Partial Marks : +3 If all the four options are correct but ONLY three options are chosen;
Partial Marks : +2 If three or more options are correct but ONLY two options are chosen, both of which are correct;
Partial Marks : +1 If two or more options are correct but ONLY one option is chosen and it is a correctoption;
Zero Marks : 0 If unanswered;
Negative Marks : -2 In all other cases.

- For example, in a question, if (A), (B) and (D) are the ONLY three options corresponding to correct answers, then
choosing ONLY (A), (B) and (D) will get +4 marks;
choosing ONLY (A) and (B) will get +2 marks;
choosing ONLY (A) and (D) will get +2 marks;
choosing ONLY (B) and (D) will get +2 marks;
choosing $\operatorname{ONLY}(\mathrm{A})$ will get +1 mark;
choosing ONLY (B) will get +1 mark;
choosing ONLY (D) will get +1 mark;
choosing no option(s) (i.e. the question is unanswered) will get 0 marks and choosing any other option(s) will get -2 marks.
[:Q.5] A small electric dipole $\overrightarrow{\mathrm{p}}_{0}$, having a moment of inertia / about its center, is kept at a distance $r$ from the center of a spherical shell of radius $R$. The surface charge density $\sigma$ is uniformly distributed on the spherical shell. The dipole is initially oriented at a small angle $\theta$ as shown in the figure. While staying at a distance $r$, the dipole is free to rotate about its center.

If released from rest, then which of the following statement(s) is (are) correct?
[ $\varepsilon_{0}$ is the permittivity of free space.]
[:A] The dipole will undergo small oscillations at any finite value of $r$.
$[: B] \quad$ The dipole will undergo small oscillations at any finite value of $r>R$.
[:C] The dipole will undergo small oscillations with an angular frequency of

$$
\sqrt{\frac{2 \sigma p_{0}}{\varepsilon_{0} l}} \text { at } r=2 \mathrm{R}
$$

[:D] The dipole will undergo small oscillations with an angular frequency of

$$
\sqrt{\frac{\sigma p_{0}}{100 \varepsilon_{0}}} \text { at } r=10 R
$$

[:ANS] B, D
[SOLN]

Restoring torque
$\tau=-p_{0} E \sin \theta$ for small $\theta$
$\tau=-\left(P_{0} E\right) \theta \propto-\theta$
$\tau=-P_{0} \mathrm{E} \theta$
$\because \quad \tau=1 \alpha$
For angular S.H.M
$\alpha=-\omega^{2} \theta$
$\tau=-\mid \omega^{2} \theta$
From (1) and (2)
$-P_{0} E \theta=-l \omega^{2} \theta$
$\omega=\sqrt{\frac{P_{0} \mathrm{E}}{\mathrm{l}}}$
$\Rightarrow$ Angular SHM
$\left.\omega=\sqrt{\frac{p_{0} E}{I}}=\sqrt{\frac{p_{0} \sigma R^{2}}{I \epsilon_{0} r^{2}}} \right\rvert\, E=\frac{1}{4 \pi \epsilon_{0}} \frac{q}{r^{2}}, q=\sigma \times 4 \pi R^{2}$
For $r=10 R$
$\omega=\sqrt{\frac{\sigma p_{0}}{100 \epsilon_{0} \mathrm{I}}}$
[:Q.6] A table tennis ball has radius $(3 / 2) \times 10^{-2} \mathrm{~m}$ and mass $(22 / 7) \times 10^{-3} \mathrm{~kg}$. It is slowly pushed down into a swimming pool to a depth of $d=0.7 \mathrm{~m}$ below the water surface and then released from rest. It emerges from the water surface at speed $v$, without getting wet, and rises up to a height $H$. Which of the following option(s) is (are) correct?
[Given: $\pi=22 / 7, \mathrm{~g}=10 \mathrm{~m} \mathrm{~s}^{-2}$, density of water $=1 \times 10^{3} \mathrm{~kg} \mathrm{~m}^{-3}$,
viscosity of water $=1 \times 10^{-3} \mathrm{~Pa}$-s.]
[:A] The work done in pushing the ball to the depth d is 0.077 J .
[:B] If we neglect the viscous force in water, then the speed $v=7 \mathrm{~m} / \mathrm{s}$.
[:C] If we neglect the viscous force in water, then the height $\mathrm{H}=1.4 \mathrm{~m}$.
[:D] The ratio of the magnitudes of the net force excluding the viscous force to the maximum viscous force in water is 500/9.
[:ANS] A, B, D
[SOLN] Use work energy theorem
(A) $\mathrm{W}_{\mathrm{g}}+\mathrm{W}_{\text {up }}+\mathrm{W}_{\text {ext }}+\mathrm{W}_{\text {vis }}=\mathrm{k}_{\mathrm{f}}-\mathrm{k}_{\mathrm{i}}$
$W_{\text {ext }}=-W_{g}-W_{\text {up }}$
$=-\operatorname{Mgd}-(-\mathrm{V} \rho g \mathrm{~d})$
$=g d\left(\frac{4}{3} \pi r^{3} \mathrm{~J}-\mathrm{M}\right)$
0.077 J
(B) Again using work energy theorem

$$
\begin{aligned}
& \mathrm{W}_{\mathrm{g}}+\mathrm{W}_{\mathrm{up}}=\frac{1}{2} \mathrm{mv}^{2} \\
& \Rightarrow \mathrm{mgd}+\mathrm{V} \rho \mathrm{dg}=\frac{1}{2} \mathrm{mv}^{2} \\
& \Rightarrow \mathrm{~V}=7 \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

(C) $\mathrm{H}=\frac{\mathrm{v}^{2}}{2 \mathrm{~g}}$
(D) $\frac{\mathrm{F}_{\text {up }}-\mathrm{Mg}}{6 \pi \eta r v}$
[:Q.7] A positive, singly ionized atom of mass number AM is accelerated from rest by the voltage 192 V . Thereafter, it enters a rectangular region of width w with magnetic field $\overrightarrow{\mathrm{B}}_{0}=0.1 \hat{\mathrm{k}}$

Tesla, as shown in the figure. The ion finally hits a detector at the distance x below its starting trajectory.
[Given: Mass of neutron/proton $=(5 / 3) \times 10^{-27} \mathrm{~kg}$, charge of the electron $=1.6 \times 10^{-19} \mathrm{C}$.]

Which of the following option(s) is (are) correct?
[:A] The value of $x$ for $\mathrm{H}^{+}$ion is 4 cm .
[:B] The value of $x$ for an ion with $A_{M}=144$ is 48 cm .
[:C] For detecting ions with $1 \leq A_{M} \leq 196$, the minimum height ( $x_{1}-x_{0}$ ) of the detector is 55 cm .
[:D] The minimum width $w$ of the region of the magnetic field for detecting ions with $A_{M}=196$ is 56 cm.
[:ANS] A, B
[:SOLN]

$$
\begin{aligned}
x & =2 R \\
& =\frac{2 \sqrt{2 q v_{0} m}}{q B} \\
x & =\sqrt{\frac{8 v_{0} m}{q B^{2}}}
\end{aligned}
$$

(A) for $\mathrm{H}^{+} \mathrm{q}=1.6 \times 10^{-19}$

$$
\mathrm{m}=\frac{5}{3} \times 10^{-27}
$$

$$
\Rightarrow x=4 \mathrm{~cm}
$$

(B) for $A_{m}=144, m=\frac{5}{3} \times 10^{-27} \times 144$
$\mathrm{q}=1.6 \times 10^{-16}$
$x=48 \mathrm{~cm}$
(C) for $\mathrm{Am}=1 \quad \mathrm{x}=4 \mathrm{~cm}$

For $A m=196 x,=56 \mathrm{~cm}$
$x_{1}-x_{0}=51 \mathrm{~cm}$
(D) for $\mathrm{Am}=196, \mathrm{R}=28 \mathrm{~cm}$

## SECTION 3 (Maximum Marks :24)

- This section contains SIX (06) questions.
- The answer to each question is a NON-NEGATIVE INTEGER.
- For each question, enter the correct integer corresponding to the answer using the mouse and the onscreen virtual numeric keypad in the place designated to enter the answer.
- Answer to each question will be evaluated according to the following marking scheme:

Full Marks : +4 If ONLY the correct integer is entered;
Zero Marks : 0 In all other cases.
[:Q.8] The dimensions of a cone are measured using a scale with a least count of 2 mm . The diameter of the base and the height are both measured to be 20.0 cm . The maximum percentage error in the determination of the volume is $\qquad$ .
[:ANS] 3
[:SOLN] $V=\frac{1}{3} \pi\left(\frac{\mathrm{D}}{4}\right)^{2} \mathrm{~h}$
$\% \mathrm{~V}=2 \% \mathrm{D}+\% \mathrm{~h}$
$=\left(2 \times \frac{\Delta \mathrm{D}}{\mathrm{D}}+\frac{\Delta \mathrm{h}}{\mathrm{h}}\right) \times 100 \%$
$\mathrm{D}=200 \mathrm{~mm}$
$\mathrm{h}=200 \mathrm{~mm}$
$\Delta \mathrm{D}=\Delta \mathrm{h}=2 \mathrm{~mm}$
$=\left(2 \times \frac{2}{200}+\frac{2}{200}\right) \times 100 \%$
= $3 \%$
[:Q.9] A ball is thrown from the location $\left(x_{0}, y_{0}\right)=(0,0)$ of a horizontal playground with an initial speed $v_{0}$ at an angle $\theta_{0}$ from the $+x$-direction. The ball is to hit by a stone, which is thrown at the same time from the location $\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)=(\mathrm{L}, 0)$. The stone is thrown at an angle (180- $\theta_{1}$ )
from the $+x$-direction with a suitable initial speed. For a fixed $v_{0}$, when $\left(\theta_{0}, \theta_{1}\right)=\left(45^{\circ}, 45^{\circ}\right)$, the stone hits the ball after time $\mathrm{T}_{1}$, and when $\left(\theta_{0}, \theta_{1}\right)=\left(60^{\circ}, 30^{\circ}\right)$, it hits the ball after time $\mathrm{T}_{2}$. In such a case, $\left(T_{1} / T_{2}\right)^{2}$ is $\qquad$ .
[:ANS] 2
[:SOLN]

For $\left(\theta_{0}, \theta_{1}\right)=\left(45^{\circ}, 45^{\circ}\right)$
$u=v_{0}$ (By equating $y$-coordinate of particles)
$\ell$ along x -axis
$\frac{\mathrm{v}_{0}}{\sqrt{2}} \times 2 \mathrm{~T}_{1}=\mathrm{L} \quad \Rightarrow \mathrm{T}_{1}=\frac{\mathrm{L}}{\sqrt{2} \mathrm{v}_{0}}$
For $\left(\theta_{0}, \theta_{1}\right)=\left(60^{\circ}, 30^{\circ}\right)$
$u=\sqrt{3} v_{0}$
and again along $x$-axis
$\left[\frac{\mathrm{v}_{0}}{2}+\frac{\left(\sqrt{3} \mathrm{v}_{0}\right) \sqrt{3}}{2}\right] \mathrm{T}_{2}=\mathrm{L} \Rightarrow\left(\frac{4 \mathrm{v}_{0}}{2}\right) \mathrm{T}_{2}=\mathrm{L}$
$\Rightarrow \quad \mathrm{T}_{2}=\frac{\mathrm{L}}{2 \mathrm{v}_{0}}$
Now $\left(\frac{T_{1}}{T_{2}}\right)^{2}=2$
[:Q.10] A charge is kept at the central point $P$ of a cylinder region. The two edges subtend a halfangle $\theta$ at $P$, as shown in the figure. When $\theta=30^{\circ}$, then the electric flux through the curved surface of the cylinder is $\Phi$. If $\theta=60^{\circ}$, then the electric flux through the curved surface becomes $\Phi / \sqrt{n}$, where the value of $n$ is $\qquad$

[:ANS] 3
[:SOLN] $\phi=\frac{q}{\epsilon_{0}}-2 \frac{q}{2 \epsilon_{0}}\left(1-\cos 30^{\circ}\right)=\frac{q}{\epsilon_{0}}\left(\frac{\sqrt{3}}{2}\right)$
$\phi^{\prime}=\frac{\mathrm{q}}{\epsilon_{0}}-2 \frac{\mathrm{q}}{2 \epsilon_{0}}\left(1-\frac{1}{2}\right)=\frac{\mathrm{q}}{2 \epsilon_{0}}=\phi / \sqrt{3}$
$\therefore \mathrm{n}=3$
[:Q.11] Two equilateral-triangular prisms $\mathrm{P}_{1}$ and $\mathrm{P}_{2}$ are kept with their sides parallel to each other, in vacuum, as shown in the figure. A light ray enters prism $P_{1}$ at an angle of incidence $\theta$ such that the outgoing ray undergoes minimum deviation in prism $\mathrm{P}_{2}$. If the respective refractive indices of $P_{1}$ and $P_{2}$ are $\sqrt{\frac{3}{2}}$ and $\sqrt{3}$, then $\theta=\sin ^{-1}\left[\sqrt{\frac{3}{2}} \sin \left(\frac{\pi}{\beta}\right)\right]$, where the value of $\beta$ is $\qquad$ .

[:ANS] 12
[:SOLN]

At face $P Q$ using snell's law
$1 \sin i=\sqrt{3} \sin 30^{\circ}$ (for minimum deviation $r_{1}=r_{2}=\frac{A}{2}=30^{\circ}$ )
$\Rightarrow \mathrm{i}=60^{\circ}$
At force AC again using snell's law
$\sqrt{\frac{3}{2}} \sin _{2}=1 \sin 60^{\circ}$
$\Rightarrow r_{2}=45^{\circ}$

Hence, $r_{1}=15^{\circ}=\frac{\pi}{12}$
At face $A B$ using snell's law
$\sin \theta=\sqrt{\frac{3}{2}} \sin \frac{\pi}{12}$
$\theta=\sin ^{-1}\left[\sqrt{\frac{3}{2}} \sin \frac{\pi}{12}\right]$
$\therefore \beta=12$
[:Q.12] An infinitely long thin wire, having a uniform charge density per unit length of $5 \mathrm{nC} / \mathrm{m}$, is passing through a spherical shell of radius 1 m , as shown in the figure. A 10 nC charge is distributed uniformly over the spherical shell. If the configuration of the charges remains static, the magnitude of the potential difference between points $P$ and $R$, in Volt, is $\qquad$ .
[ Given: In SI units $\frac{1}{4 \pi \varepsilon_{0}}=9 \times 10^{9}, \ln 2=0.7$. Ignore the area pierced by the wire]

[:ANS] 171
[:SOLN] Due to spherical shell,
$V_{P}-V_{R}=\frac{k Q_{\text {shell }}}{R}-\frac{k Q_{\text {shell }}}{2 R}$
$=\frac{9 \times 10^{9} \times 10 \times 10^{-9}}{2 \times 1}=45$ Volt
Due to wire

$$
\begin{aligned}
& V_{P}-V_{R}=\frac{1}{\pi \epsilon_{0}} \ln 2 \\
& =5 \times 10^{-9} \times 9 \times 10^{9} \times 4 \times 0.7=126 \text { Volt } \\
& \therefore \text { Total } \mathrm{V}_{\mathrm{P}}-\mathrm{V}_{\mathrm{R}}=126+45=171 \text { Volt. }
\end{aligned}
$$

[:Q.13] A spherical soap bubble inside an air chamber at pressure $P_{0}=10^{5} \mathrm{~Pa}$ has a certain radius so that the excess pressure inside the bubble is $\Delta \mathrm{P}=144 \mathrm{~Pa}$. Now, the chamber pressure is reduced to $8 \mathrm{P}_{0} / 27$ so that the bubble radius and its excess pressure change. In this process, all the temperatures remain unchanged. Assume air to be an ideal gas and the excess pressure $\Delta \mathrm{P}$ in both the cases to be much smaller than the chamber pressure. The new excess pressure $\Delta \mathrm{P}$ in Pa is $\qquad$ .
[:ANS] 96
[:SOLN] Let old and new radii are $r$ and $r^{\prime}$ respectively.

$$
\begin{aligned}
& 144=\frac{4 S}{r} \Rightarrow r=\frac{4 S}{144} \\
& \Delta P=\frac{4 S}{r^{\prime}} \Rightarrow r^{\prime}=\frac{4 S}{\Delta P}
\end{aligned}
$$

Now for soap bubble using $P_{1} V_{1}=P_{2} V_{2}$

$$
\left(P_{0}+144\right)\left(\frac{4 S}{144}\right)^{3}=\left(\frac{8 P_{0}}{27}+\Delta P\right)\left(\frac{4 S}{\Delta P}\right)^{3}
$$

On solving the equation -
$\Delta \mathrm{P}=96$ Pascal

## SECTION 4 (Maximum Marks :12)

- This section contains TWO (02) paragraphs.
- Based on each paragraph, there are TWO (02) questions.
- The answer to each question is a NUMERICAL VALUE.
- For each question, enter the correct numerical value of the answer using the mouse and the on screen virtual numeric keypad in the place designated to enter the answer.
- If the numerical value has more than two decimal places, truncate/round-off the value to TWO decimal places.
- Answer to each question will be evaluated according to the following marking scheme:

Full Marks : +3 If ONLY the correct numerical value is entered in the designated place; Zero Marks : 0 In all other cases.

## Passage-1

In a Young's double slit experiment, each of the two slits $A$ and $B$, as shown in the figure, are oscillating about their fixed center and with a mean separation of 0.8 mm . The distance between the slits at time $t$ is given by $\mathrm{d}=(0.8+0.04 \sin \omega \mathrm{t}) \mathrm{mm}$, where $\omega=0.08 \mathrm{rad} \mathrm{s}^{-1}$. The distance of the screen from the slits is 1 m and the wavelength of the light used to illuminate
the slits is $6000 \AA$. The interference pattern on the screen changes with time, while the central bright fringe (zeroth fringe) remains fixed at point $O$.

[:Q.14] The $8^{\text {th }}$ bright fringe above point $O$ oscillates with time between two extreme positions. The separation between these two extreme positions, in micrometer ( $\mu \mathrm{m}$ ), is $\qquad$ .
[:ANS] 600
[:SOLN] Position of $8^{\text {th }}$ maxima from O ,
$y=8\left(\frac{\lambda D}{d}\right)$
$y=60 \times 10^{-4}[1-0.05 \sin \omega t]$
Velocity of $8^{\text {th }}$ maxima

$$
\begin{aligned}
v & =\frac{d y}{d t}=60 \times 10^{-4}[-0.05 \omega \cos \omega t] \\
& =-24 \cos \omega t \mu \mathrm{~m} / \mathrm{s}
\end{aligned}
$$

Separation b/w two extremes of $8^{\text {th }}$ maxima $=60 \times 10^{-4} \times 0.1 \mathrm{~m}=600 \mu \mathrm{~m}$
[:Q.15] The maximum speed in $\mu \mathrm{m} / \mathrm{s}$ at which the $8^{\text {th }}$ bright fringe will move is $\qquad$ .

## [:ANS] <br> 24

[:SOLN] Position of $8^{\text {th }}$ maxima from O ,
$y=8\left(\frac{\lambda D}{d}\right)$
$y=60 \times 10^{-4}[1-0.05 \sin \omega t]$
Velocity of $8^{\text {th }}$ maxima
$v=\frac{\mathrm{dy}}{\mathrm{dt}}=60 \times 10^{-4}[-0.05 \omega \cos \omega \mathrm{t}]$

$$
=-24 \cos \omega \mathrm{t} \mu \mathrm{~m} / \mathrm{s}
$$

Maxima speed of $8^{\text {th }}$ maxima $\mathrm{V}_{\max }=24 \mu \mathrm{~m} / \mathrm{s}$

## Passage-2

Two particles, 1 and 2, each of mass m, are connected by a massless spring, and are one a horizontal frictionless plane, as shown in the figure. Initially, the two particles, with their center of mass at $\mathrm{x}_{0}$, are oscillating with amplitude a and angular frequency $\omega$. This their positions at time t are given by $\mathrm{x}_{1}(\mathrm{t})=\left(\mathrm{x}_{0}+\mathrm{d}\right)+\mathrm{a} \sin \omega \mathrm{t}$ and $\mathrm{x}_{2}(\mathrm{t})=\left(\mathrm{x}_{0}-\mathrm{d}\right)-\mathrm{a} \sin \omega \mathrm{t}$, respectively, where $d>2 a$. Particle 3 of mass $m$ moves towards this system with speed $u_{0}=a \omega / 2$, and undergoes instantaneous elastic collision with particle, 2 , at time $t_{0}$. Finally, particles 1 and 2 acquire a center of mass speed $v_{\mathrm{cm}}$ and oscillate with amplitude b and the same angular frequency $\omega$.

[:Q.16] If the collision occurs at time $\mathrm{t}_{0}=0$, the value of $v_{\mathrm{cm}} /(\mathrm{a} \omega)$ will be $\qquad$ .
[:ANS] 0.75
[:SOLN]

$V_{c m}=\frac{3}{4} a \omega$
$\Rightarrow \frac{\mathrm{V}_{\mathrm{cm}}}{\mathrm{a} \omega}=\frac{3}{4}=0.75$
[:Q.17] If the collision occurs at time $t_{0}=\pi /(2 \omega)$, then the value of $4 \mathrm{~b}^{2} / \mathrm{a}^{2}$ will be $\qquad$ -
[:ANS] 4.25
[:SOLN] at $\mathrm{t}=\frac{\pi}{2 \omega}$ balls 1 and 2 will be at their extreme positions i.e. at rest.
Using COE for system of balls 1 and 2 after collision of ball 3 with ball 2 :

$$
\begin{aligned}
& \frac{1}{2} m\left(\frac{a \omega}{2}\right)^{2}+\frac{1}{2} m \omega^{2}(2 a)^{2}=\frac{1}{2} m \omega^{2}(2 b)^{2} \\
& \frac{17 a^{2}}{8}=2 b^{2} \\
& \Rightarrow \frac{4 b^{2}}{a^{2}}=\frac{17}{4}=4.25
\end{aligned}
$$
